CivEnv 304 – Civil and Environmental Engineering Systems Analysis
Spring 2022

Instructor	Pablo L. Durango-Cohen Office: Tech A319 Office Hours: Tuesday 11:00–12:00, and by appointment Phone: (847)491-4008 Email: `pdc@northwestern.edu`
Teaching Assistant	Sharika Hegde Office Hours: Monday 10:00–12:00 and Wednesday 6:00–8:00, and by appointment Location: Tech A125 Email: `sharikahegde2025@u.northwestern.edu`
Grader	Cal Skiles Office Hours: Please email, and include `CivEnv 304` in the subject Email: `calskiles@u.northwestern.edu`
Class Times and Locations:	Tuesday and Thursday 9:30–10:50 in Tech LG66
Class Website:	Canvas – Northwestern Course Management System

Note that office hours will begin the week of April 4.

Course Description

This course explores problems that arise in planning and managing CEE systems. The methods introduced in the course, often used in the management sciences, will provide a basis for developing descriptive and prescriptive models that can address a broad range of problems. Examples include space allocation in an industrial park, equipment selection for energy generation, scheduling construction projects, designing warehousing and distribution strategies for companies, locating (emergency) services such as fire stations, docks for bike-sharing services, and the design and management of water distribution systems. We will model problems using techniques from engineering economics, decision analysis, mathematical programming, and solve them using commercial software (Excel).

Intended Audience

The intended audience for this course consists of upper-division undergraduate and first-year graduate students in Engineering and Sciences.

Objectives

During the course, students will:

1. Develop a "systems perspective" necessary for planning and managing large-scale engineering systems;
2. Formulate and solve quantitative models for a range of civil and environmental engineering systems problems; and

3. Use commercial software to solve engineering problems.

Prerequisites

Calculus and Probability. These requirements are loose and all required material will be covered in class.

Materials

The required textbook for the class is Revelle, C.S., Whitlatch, E.E., and Wright, J.R. (2003); *Civil and Environmental Systems Engineering*, Second Edition; Prentice Hall.

Other reference texts include:

1. deNeufville, R. (1990); *Applied Systems Analysis*; McGraw-Hill. This book is out of print, but available on-line for free. `https://web.mit.edu/ardent/www/ASA_Text/asa_Text_index.html`
2. Hillier, F. and Lieberman, G. (2021); *Introduction to Operations Research*; 11th Edition, McGraw-Hill.
3. Park, C. (2016); *Contemporary Engineering Economics*; Sixth Edition, Prentice Hall.

Outline

The course integrates methodological tools with applications. Lectures will be devoted to learning the tools and solving problems to reinforce the material. In addition, there will be sessions devoted to learning how to solve the problems using commercial software (MS Excel). The material covered addresses two important elements in systems engineering: Policy Evaluation and Policy Selection, i.e., System Optimization. The material includes:

Topic	**Approximate Duration**
Economic Evaluation of Projects Cash-flow evaluation Project selection Financial products, e.g., loans, stocks, bonds, and options	3 weeks
Decision Analysis Decision trees Backwards induction Value of information	2 weeks
Mathematical Programming Review of Calculus (constrained optimization) Formulation of Linear Programs Graphical solution of linear programs Sensitivity Analysis	3 weeks

This outline is subject to change in order to accommodate time and interests.

Requirements and Assessment

1. Homework will be assigned approximately on a weekly basis and will be due by the start of class as indicated on the assignments. Homework submission will be via file upload to Canvas. While all file types will be accepted, we strongly suggest that you restrict yourself to .pdf, .docx, .xlsx, .jpg files. Taking pictures or scanning work that you do by hand, and uploading spreadsheets is probably the most efficient approach. To avoid technical problems and various restrictions, links to cloud drives or other storage devices will not be accepted. Long story short, if we can't access your homework, we can't grade it. Solutions will be posted shortly after the assignments are due. Therefore, no late homework can be accepted. Given the size of the class and the available resources, 50% of the homework problems may be selected at random and graded thoroughly. The assignment with the lowest scores (by percentage) will be dropped from the final homework score. You should start working on the homework early so that you have time to ask questions in class, and during office hours before the due date. Please feel free to work in groups, or to ask for help from fellow students, the instructor, the teaching assistants, or the grader. However, please note that each student must submit **their own work** unless otherwise stated. To earn credit on assignments, you must **show your work**, i.e., writing an answer, even if correct, is not sufficient to earn credit.

   The assignments may have some in-depth problems that will be labeled "Extra Credit". These problems are not required for the course but thorough solutions may be rewarded with extra credit. To avoid getting side-tracked, you should only work on the extra-credit problems once you complete the required problems.

2. There will be two case studies assigned. The case studies are meant to give the students experience addressing problems in civil and environmental engineering that are richer (in scale and scope) than textbook problems. At their core, the case studies will involve formulating quantitative models for the problems, using software to solve them, and making recommendations. A short report will be submitted for each case study. The report will give the students an opportunity to discuss issues that may not be captured in the models.
   Students will have 2–3 weeks to complete the case studies. Specific instructions will be provided along with the first case study. Students are highly encouraged to work in groups of 4 (one report per group).

3. There will be 2 in-class examinations. They will be open-book/notes and will be designed to test your understanding of the material presented in class and in the homework assignments. The dates for the exams are **Tuesday, May 3, and Thursday, June 2**.
   Special arrangements for the exams must be discussed with the instructor 2 weeks prior to the exam's scheduled date. Following guidelines provided by AccessibleNU, any student requesting accommodations related to a disability or other condition is required to register with AccessibleNU (accessiblenu@northwestern.edu; 847-467-5530) and provide professors with an accommodation notification from AccessibleNU, preferably within the first two weeks of class. All information will remain confidential.

In terms of assessment, the final class score will be computed as the maximum of the following 2 alternatives:[1]

$$\text{Alt 1:} \quad 0.2 \times (\text{homework} + \text{exam 1} + \text{exam 2} + \text{case study 1} + \text{case study 2})$$
$$\text{Alt 2:} \quad 0.25 \times (\text{homework} + \max\{\text{exam 1, exam 2}\} + \text{case study 1} + \text{case study 2})$$

To receive a passing grade in the course, you must complete both case studies, and exam 1.

[1] The terms in the expressions below correspond to percentages, and thus the final class score is a percentage.

ABET Educational Outcomes

For students completing undergraduate degree programs in civil engineering or in environmental engineering, this course supports the programs' educational objectives by addressing the following student outcomes:[2]

(1) An ability to identify, formulate, and solve complex engineering problems by applying principles of engineering, science, and mathematics. (H,E,R)[3]

(2) An ability to apply engineering design to produce solutions that meet specified needs with consideration of public health, safety, and welfare, as well as global, cultural, social, environmental, and economic factors. (H,E,R)

(3) An ability to communicate effectively with a range of audiences. (R)

(4) An ability to recognize ethical and professional responsibilities in engineering situations and make informed judgments, which must consider the impact of engineering solutions in global, economic, environmental, and societal contexts. (R)
